Research into psychedelic drugs and their therapeutic potential has gained increasing attention in recent years, however an understanding of the psychological mechanisms by which these substances exert their influence is not yet fully established. The purpose of this thesis was to better understand the relationship between psychedelic drug use and the psychotherapeutic constructs implicated in explaining their proposed benefits.

This volume is comprised of three parts. Part One presents a review of relevant literature, pertaining to the question of which psychotherapeutic constructs may be relevant to psychedelic experiences and their effects. The relevance of constructs such as 'mindfulness' and 'psychological flexibility' are considered, as well as the role of psychedelic-induced 'mystical experiences'.

Part Two of the thesis describes an exploratory cross-sectional study, gathering data from a large sample of recreational psychedelic drug users using an internet-based survey. This study explored the association between lifetime psychedelic drug use, mystical experiences, mindfulness and depression, and examined the pathways between demonstrated effects.

Finally, a critical appraisal of the process of conducting the research is provided. This includes personal reflections on the undertaking of research within the subject area of psychedelics, as well as a consideration of the process of establishing a direction for the study from a psychological position.

A revival of interest in the therapeutic potential of psychedelic drugs has been seen in recent years, with an evidence-base for their application in the treatment of mental health problems expanding. Whilst benefits have been demonstrated in depression and addiction, for example, the mechanisms by which psychedelics exert their therapeutic effects are not yet fully understood. Evidence to date has explored aspects of the acute psychedelic experience (i.e. 'mystical experiences') which appear to be important in explaining their therapeutic effects. Likely change processes at a neurobiological level have also been identified, however psychological mechanisms remain unclear. The role of mindfulness has very recently been investigated with regard to psychedelics, with studies suggesting increases in this capacity following their use. The aim of this study was therefore to explore the relationship between mindfulness-related constructs, mental health, psychedelic use, and psychedelic-induced mystical experiences.

It is envisaged that findings will contribute to a growing understanding of the psychological pathways involved in psychedelic effects and potentially inform future research on their therapeutic use. By providing preliminary exploratory data from a large sample of psychedelic users, support may be provided for future research on the relevance of mindfulness-related psychotherapeutic constructs, both enabling an understanding of the mechanisms of change in psychedelic therapy and improving our understanding of the recreational use of these drugs.

acknowledgements

This thesis would not have been possible without the invaluable contribution of Professor Sunjeev Kamboj. I am extremely grateful for his thoughtful advice and insightful supervision throughout the project. Thank you for your guidance.

acknowledgements

I would also like to express thanks to the UK Psychedelic Society, the Multidisciplinary Association for Psychedelic Studies, and members of the UCL Clinical Psychopharmacology Unit, for kindly advertising this study to their networks. Thank you also to the individuals who volunteered to share their experience and expertise with me, and to every person who participated in the study and shared it with others. I hope the topic prompted some interesting conversations as it has done for me.

acknowledgements

To each and every one of my amazing friends, thank you for being my constant providers of support and silliness. A special thank you to Lucy, for donating her artwork to this project, and for proofreading so very many words.

acknowledgements

To my parents, for their unrelenting belief in me. Thank you for your boundless warmth and wisdom, for reminding me of what's truly important, and that
این هم میگذرد.

acknowledgements

To Arianne, whose involvement in the recruitment for this project is deeply appreciated. Thank you for sparing me the perplexing world of social media pages and reddit threads. As my big sister, thank you for your infinite energy, enthusiasm and encouragement, for the unfathomably long phone calls, and for the one thousand other ways in which you are wonderful.

acknowledgements

Thank you to Antonio, for his unwavering kindness and patience, and for walking alongside me through difficult times. I am endlessly grateful for you.

acknowledgements

Finally, thank you to my UCL DClinPsy class. There isn't any other assortment of people I would have rather shared this journey with. I am honoured to have learnt and laughed alongside you.

Part 1: Literature Review

Content
heading

'Third-Wave' psychotherapeutic constructs and their relevance to the psychedelic experience.

This literature review takes the form of a conceptual introduction, providing an comprehensive overview of those constructs investigated as part of the empirical study of this thesis (see Part 2). An introduction to classic psychedelic drugs and psychedelic experiences is provided, including a consideration of mystical and/or challenging or difficult experiences. The evidence regarding therapeutic outcomes following psychedelic use is discussed, as well as an overview of theories which seek to explain these effects. A proposed overlap between psychedelic experiences and meditative practices is examined, and relevant aspects of ‘third wave’ cognitive-behavioural psychotherapeutic approaches are identified, such as ‘mindfulness’ and ‘psychological flexibility’ (core components of Acceptance and Commitment Therapy (ACT)). The value that these psychotherapeutic constructs may hold in understanding, supporting and integrating psychedelic experiences is explored, and discussed in relation to both acute and sustained effects.

Having highlighted the relevance of mystical experiences and mindfulness-related capacities with regard to psychedelics and their therapeutic potential, this review concludes by outlining the aims of the empirical study presented in Part 2.
